第一章 项目底层架构

- 1. 项目介绍
 - 1.2 技术栈
 - 1.3 架构图
- 2. 搭建项目
 - 2.1 项目基本结构
 - 2.2 项目启动顺序
 - 2.2 搭建前端项目
 - 2.4 搭建后端项目
 - 2.4.1 Nacos
 - 2.4.2 父工程
 - 2.4.3 基类工程
 - 2.4.4 微服务网关
 - 2.4.4 系统管理微服务
- 3.1 代码复用
 - 3.1 后端复用
 - 3.1.1 实体类基类
 - 3.1.2 Dao的基类
 - 3.1.3 service基类
 - 3.1.4 controler基类
 - 3.2 前端复用
 - 3.2.1 重用逻辑分析
 - 3.2.1 base-list
 - 3.2.2 base-edit
 - 3.2.3 base-tree
- 4. 岗位管理
 - 4.1 后端代码
 - 4.1.1 实体类
 - 4.1.2 dao

- 4.1.3 service
- 4.1.4 Mybatis配置类
- 4.2 前端组件
 - 4.2.1 list.vue
 - 4.2.2 edit.vue
- 5. 部门管理
 - 5.1 后端代码
 - 5.1.1 实体类
 - 5.1.2 dao
 - 5.1.3 service
 - 5.1.4 Controller
 - 5.2 前端组件
 - 5.2.1 list.vue
 - 5.2.2 edit.vue

1. 项目介绍

乐购商城是类似于京东商城,是一个全品类电商项目,后台实现,商品,分类,规格,品牌,以及用户角色权限的管理,前端查询商品,加入购物车,创建订单,第三方支付,以及商品秒杀功能。从0到1,掌握微服务架构、分布式、vue、全栈开发,以及电商千万级并发场景,解决方案。

1.2 技术栈

- Spring Boot 2.3.2.RELEASE
- Spring Cloud Hoxton.SR8
- Spring Cloud Alibaba 2.2.5.RELEASE
- Mybatis 3.5.4
- Mybatis Plus 3.3.2
- Spring Security OAuth2 2.2.4.RELEASE
- Vue 2.5.10
- Vuex 3.0.1
- IView 3.2.2

1.3 架构图

架构图水平面上的业务模块,加上垂直面上的技术模块,互相依赖形成的逻辑结构图,如图1-1所示。

图1-1 乐购商城架构图

2. 搭建项目

2.1 项目基本结构

项目分为前端项目和后端项目,基本工程分类如下图2-1所示

图2-1 项目工程结构分类

2.2 项目启动顺序

- 后端项目启动顺序
 先启动授权中心(负责颁发和校验令牌),其他微服务后启动
- 2. 前端项目启动

```
XML ②复制代码
1 npm install (yarn)
2 npm run dev (yarn dev)
```

2.2 搭建前端项目

项目前端组件使用Vue和IView开发,这里时间关系就不带领大家使用vue cli依次从头创建前端项目,大家可以直接使用,素材提供的前端项目,开发后续业务应用,**注意前端项目虽然提供提供底层架构代码,业务代码,但是还是推荐大家根据业务自行开发**,同时也会讲解典型前端业务代码实现。前端工程结构如图1–2所示。

图1-2 前端项目结构

从素材中拷贝前端项目后,运行 cnpm install 命令,安装依赖组件

运行 npm run dev ,或者在idea中配置如图1-3所示,运行前端项目

🚇 Run/Debug Configurations				×
; + − □ ■ ↓ ↓ 2 ∨ □ npm □ legou-manager-ui	<u>N</u> ame: legou-m	anager-ui	Allow parallel run	Store as project file 😃
legou-portal-ui > Spring Boot	package.json: Command: Scripts:	D:\work\31_legou\project\legou-manager- run dev	ui\package.json	v
	A <u>rg</u> uments: Node <u>i</u> nterpreter: Node options: Package <u>m</u> anager:	Project node (D:\java\nodejs\node.exe) Project ~\AppData\Roaming\npm\node m	oodules\varn	+ 14.6.0 ▼ 1.22.17 ▼

图1-3 idea运行vue项目

前端去掉认证授权代码修改如下。 src\components\main\main.vue

```
Java ②复制代码
menuList() {
//return this.$store.getters.menuList
},
```

```
1 router.beforeEach((to, from, next) => {
2    iView.LoadingBar.start()
3    const token = getToken()
4    next()
5 })
```

2.4 搭建后端项目

2.4.1 Nacos

项目采用Nacos作为注册中心和配置中心,Nacos是阿里巴巴开源的一款支持服务注册与发现,配置管理以及微服务管理的组件。用来取代以前常用的注册中心(ZooKeeper, Eureka等),以及配置中心(Spring Cloud Config等)。Nacos是集成了注册中心和配置中心的功能。

在使用Nacos之前需要先下载Nacos Server,下载地址:

https://github.com/alibaba/nacos/releases/download/1.4.1/nacos-server-1.4.1.zip。

启动Nacos命令如下。

```
Java 口复制代码
bin/startup.sh -m standalone # linux
bin/startup.cmd -m standalone # windows
```

或者修改配置文件startup.cmd,代码如下,默认为cluster,然后直接运行startup.cmd

```
XML の复制代码
1 set MODE="standalone"
```

然后访问http://localhost:8848/nacos,进入nacos管控台,默认账号密码为nacos/nacos,如图1-4所示。

图1-4 Nacos管控台

导入素材提供的配置到Nacos,具体业务用的的配置,在业务中在详细讲解,Nacos配置如图1–5所示。

图1-5 Nacos中的配置

2.4.2 父工程

创建legou-parent统一管理聚合子工程的依赖构件的版本号, pom.xml如下所示。

- spring boot 2.3.2.RELEASE
- spring cloud Hoxton.SR8

• spring cloud albiaba 2.2.5.RELEASE

```
<?xml version="1.0" encoding="UTF-8"?>
 1
 2
    3
             xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 4
             xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
    http://maven.apache.org/xsd/maven-4.0.0.xsd">
        <modelVersion>4.0.0</modelVersion>
 5
 6
 7
        <aroupId>com.lxs</aroupId>
8
        <artifactId>legou-parent</artifactId>
        <version>1.0-SNAPSHOT
9
10
        <modules>
11
            <module>legou-auth-center</module>
12
            <module>leaou-core</module>
13
            <module>legou-admin</module>
14
            <module>legou-gateway</module>
15
            <module>legou-security</module>
            <module>legou-upload</module>
16
            <module>legou-item</module>
17
18
            <module>legou-search</module>
19
            <module>leaou-common</module>
20
            <module>legou-canal</module>
            <module>legou-page</module>
21
22
            <module>legou-order</module>
23
            <module>legou-pay</module>
24
            <module>legou-seckill</module>
25
        </modules>
26
27
        <packaging>pom</packaging>
28
29
        <parent>
30
            <groupId>org.springframework.boot</groupId>
31
            <artifactId>spring-boot-starter-parent</artifactId>
32
            <version>2.3.2.RELEASE
            <relativePath/> <!-- lookup parent from repository -->
33
34
        </parent>
36
        cproperties>
37
            <java.version>1.8</java.version>
            <alibaba-cloud.version>2.2.5.RELEASE</alibaba-cloud.version>
39
            <springcloud.version>Hoxton.SR8</springcloud.version>
        </properties>
40
41
42
        <dependencyManagement>
            <dependencies>
43
44
                <dependency>
45
                    <groupId>org.springframework.cloud
46
                    <artifactId>spring-cloud-dependencies</artifactId>
                    <version>${springcloud.version}</version>
47
```

```
48
                    <type>pom</type>
49
                    <scope>import</scope>
50
                </dependency>
51
52
                <dependency>
53
                    <groupId>com.alibaba.cloud
54
                    <artifactId>spring-cloud-alibaba-dependencies</artifactId>
55
                    <version>${alibaba-cloud.version}
                    <type>pom</type>
56
57
                    <scope>import</scope>
58
                </dependency>
59
            </dependencies>
60
        </dependencyManagement>
61
62
        <dependencies>
63
            <dependency>
64
                <groupId>org.apache.commons
65
                <artifactId>commons-lang3</artifactId>
                <version>3.9
66
            </dependency>
67
        </dependencies>
68
69
70
        <build>
            <plugins>
71
72
                <plugin>
                    <groupId>org.springframework.boot
73
74
                    <artifactId>spring-boot-maven-plugin</artifactId>
75
                </plugin>
            </plugins>
77
        </build>
79
    </project>
80
```

2.4.3 基类工程

创建legou-core基类工程,主要实现dao, service, controller基类,和项目用到的工具类,比如雪花算法工具类等。直接拷贝使用,具体代码复用实现下一个小节详细讲解。

2.4.4 微服务网关

创建legou-gateway网关工程。

1. pom.xml

44

45

</dependency>

```
<!--redis-->
46
47
            <dependency>
48
               <groupId>org.springframework.boot
               <artifactId>spring-boot-starter-data-redis-reactive</artifactId>
49
50
               <version>2.1.3.RELEASE
            </dependency>
51
52
53
            <!---鉴权--->
            <dependency>
54
55
               <groupId>io.jsonwebtoken
56
               <artifactId>jjwt</artifactId>
57
               <version>0.9.0
58
            </dependency>
59
            <dependency>
60
               <groupId>com.lxs
61
62
               <artifactId>legou-security-instance</artifactId>
63
               <version>${project.version}</version>
               <exclusions>
64
                   <exclusion>
65
                       <groupId>org.springframework.boot</groupId>
66
67
                       <artifactId>spring-boot-starter-jdbc</artifactId>
                   </exclusion>
                   <exclusion>
69
70
                       <groupId>org.springframework.boot
                       <artifactId>spring-boot-starter-web</artifactId>
71
72
                   </exclusion>
73
               </exclusions>
74
            </dependency>
75
77
        </dependencies>
79
    </project>
```

2. 配置文件

application.yml

```
1 spring:
2 application:
3 name: gateway
4 profiles:
5 active: dev
```

```
YAML D复制代码
1
    spring:
2
      cloud:
3
        nacos:
4
          config:
5
            server-addr: localhost:8848
6
            file-extension: yaml
7
            extension-configs[0]:
8
              data-id: common.yaml
9
              refresh: true
10
      # 多个接口上的@FeignClient("相同服务名")会报错, overriding is disabled。
11
      # 设置 为true ,即 允许 同名
12
      main:
13
        allow-bean-definition-overriding: true
```

3. 启动器

```
₽复制代码
                                                                  Java
1
    package com.lxs.cloud;
2
3
    import org.springframework.boot.SpringApplication;
4
    import org.springframework.boot.autoconfigure.SpringBootApplication;
5
    import org.springframework.cloud.client.circuitbreaker.EnableCircuitBreaker;
    import org.springframework.cloud.client.discovery.EnableDiscoveryClient;
6
7
    import org.springframework.cloud.gateway.filter.ratelimit.KeyResolver;
    import org.springframework.cloud.openfeign.EnableFeignClients;
8
9
    import org.springframework.context.annotation.Bean;
10
    import org.springframework.web.server.ServerWebExchange;
    import reactor.core.publisher.Mono;
11
12
13
    /**
14
    * @author zhengweimin
15
     */
16
    @SpringBootApplication
17
    @EnableDiscoveryClient
    @EnableFeignClients
18
19
    @EnableCircuitBreaker
20
    public class GatewayApplication {
21
22
        public static void main(String[] args) {
23
            SpringApplication.run(GatewayApplication.class, args);
24
        }
25
26
    }
```

2.4.4 系统管理微服务

创建legou-admin,聚合父工程,在legou-admin下创建legou-admin-interface,存放接口和实体类,创建legou-admin-service,存放具体dao,service,controller实现类,这样如果其他工程只需要依赖票务管理的接口实体类,只需要引入legou-admin-interface即可。

1. legou-admin

```
XML 中复制代码
    <?xml version="1.0" encoding="UTF-8"?>
2
    project xmlns="http://maven.apache.org/POM/4.0.0"
3
             xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
4
             xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
    http://maven.apache.org/xsd/maven-4.0.0.xsd">
5
        <parent>
6
            <artifactId>legou-parent</artifactId>
7
            <groupId>com.lxs
8
            <version>1.0-SNAPSHOT
9
        </parent>
        <modelVersion>4.0.0</modelVersion>
10
11
        <artifactId>legou-admin</artifactId>
12
        <packaging>pom</packaging>
        <modules>
13
            <module>legou-admin-instance</module>
14
15
            <module>legou-admin-service</module>
16
        </modules>
17
18
    </project>
```

2. legou-admin-interface

```
XML 夕复制代码
    <?xml version="1.0" encoding="UTF-8"?>
 1
 2
    3
            xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 4
            xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
    http://maven.apache.org/xsd/maven-4.0.0.xsd">
 5
        <parent>
 6
            <artifactId>legou-admin</artifactId>
 7
            <groupId>com.lxs
8
            <version>1.0-SNAPSHOT
9
        </parent>
10
        <modelVersion>4.0.0</modelVersion>
11
12
        <artifactId>legou-admin-instance</artifactId>
13
14
        <dependencies>
15
16
            <dependency>
               <groupId>com.lxs
17
               <artifactId>legou-core</artifactId>
18
19
               <version>${project.version}</version>
20
            </dependency>
21
22
            <dependency>
23
               <groupId>org.projectlombok</groupId>
24
               <artifactId>lombok</artifactId>
25
               <scope>provided</scope>
26
            </dependency>
27
28
29
        </dependencies>
30
31
        <build>
32
            <plugins>
33
               <plugin>
34
                   <groupId>org.springframework.boot</groupId>
                   <artifactId>spring-boot-maven-plugin</artifactId>
                   <configuration>
37
                       <skip>true</skip>
                   </configuration>
39
               </plugin>
40
            </plugins>
41
        </build>
42
43
44
    </project>
```

这里要强调<skip>true<skip>,因为此工程也是从父工程继承,也就依赖了spring boot,但是此工程只是提供接口实体类,给其他工程使用,不提供spring boot的启动器,所以必须配置
<skip>true</skip>否则,maven构建时,因为找不到main方法报错。

- 3. legou-admin-service
- (1) pom.xml

```
<?xml version="1.0" encoding="UTF-8"?>
 1
 2
    3
            xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 4
            xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
    http://maven.apache.org/xsd/maven-4.0.0.xsd">
 5
        <parent>
 6
           <artifactId>legou-admin</artifactId>
           <qroupId>com.lxs
 7
8
           <version>1.0-SNAPSHOT
9
        </parent>
10
        <modelVersion>4.0.0</modelVersion>
11
12
        <artifactId>legou-admin-service</artifactId>
13
14
        <dependencies>
15
           <dependency>
16
               <groupId>org.springframework.boot
               <artifactId>spring-boot-starter-actuator</artifactId>
17
           </dependency>
18
19
           <dependency>
20
               <groupId>org.springframework.boot</groupId>
21
               <artifactId>spring-boot-starter-test</artifactId>
22
               <scope>test</scope>
23
           </dependency>
24
           <dependency>
25
               <groupId>org.springframework.boot
26
               <artifactId>spring-boot-starter-web</artifactId>
           </dependency>
27
28
           <dependency>
29
               <groupId>org.springframework.cloud
30
               <artifactId>spring-cloud-starter-openfeign</artifactId>
31
           </dependency>
32
           <!--SpringCloud ailibaba nacos -->
33
34
           <dependency>
               <groupId>com.alibaba.cloud

```

(2) 启动器

```
Java D复制代码
1
    package com.lxs.legou;
2
3
    import org.springframework.boot.SpringApplication;
    import org.springframework.boot.autoconfigure.SpringBootApplication;
4
5
    import org.springframework.cloud.client.circuitbreaker.EnableCircuitBreaker;
6
    import org.springframework.cloud.client.discovery.EnableDiscoveryClient;
7
    import org.springframework.cloud.openfeign.EnableFeignClients;
8
9
    @SpringBootApplication
10
    @EnableDiscoveryClient
11
    @EnableFeignClients
12
    @EnableCircuitBreaker
13
    public class AdminApplication {
14
15
        public static void main(String[] args) {
16
            SpringApplication.run(AdminApplication.class, args);
        }
17
18
19
    }
```

(3) 配置文件

application.yml

```
YAML ②复制代码
spring:
application:
name: admin-service
profiles:
active: dev
```

bootstrap.yml

```
YAML D复制代码
    spring:
 2
      cloud:
 3
        nacos:
4
          config:
5
            server-addr: localhost:8848
            file-extension: yaml
6
7
            extension-configs[0]:
              data-id: common.yaml
8
9
              refresh: true
10
            extension-configs[1]:
11
              data-id: db.yaml
12
              refresh: true
13
            extension-configs[2]:
              data-id: security.yaml
14
15
              refresh: true
16
      # 多个接口上的@FeignClient("相同服务名")会报错, overriding is disabled。
17
      # 设置 为true ,即 允许 同名
      main:
18
        allow-bean-definition-overriding: true
19
```

3.1 代码复用

3.1 后端复用

借鉴MybatisPlus的思想,通过po、dao、service、controller继承各自的基类,这样具体业务的 CRUD代码就不需要在写代码了,各自继承相应的基类即可,基类代码如下。

3.1.1 实体类基类

1. BaseEntity

BaseEntity是所有实体类的基类,类图如图1-6所示。

图1-6 BaseEntity类图

所有实体类都继承此基类, 比如用户, 岗位, 角色等, 代码如下。

```
Java 🗗 🗗 复制代码
1
    @Data
2
    @JsonIgnoreProperties(value = {"handler"})
    public abstract class BaseEntity implements Serializable {
4
5
     /**
      * 实体编号(唯一标识)
6
7
       */
      @TableId(value = "`id`", type = IdType.AUTO)
8
      protected Long id;
9
10
11 }
```

2. BaseTreeEntity

BaseTreeEntity是所有树结构数据的基类,类图如图1-7所示。

图1-7 BaseTreeEntity

树结构数据都继承BaseTreeEntity,比如部门,菜单等,代码如下所示。

```
Java D复制代码
    @Data
2
    @JsonIgnoreProperties(value = {"handler"})
    public class BaseTreeEntity extends BaseEntity {
4
5
        /**
6
        * 排序字段
7
        */
        @TableField("`order`")
8
9
        private Integer order;
10
11
        /**
12
        * 父节点id
13
        */
        @TableField("`parent_id`")
14
15
        private Long parentId;
16
17
        /**
18
        * 节点名称
19
        */
        @TableField("`title`")
20
21
        private String title;
22
23
        /**
24
        * 是否展开节点
25
        */
26
        @TableField("`expand`")
27
        private Boolean expand = false;
28
29 }
```

3.1.2 Dao的基类

Dao基类,类图如图1-8所示。

图1-8 Dao基类类图

ICrudDao是dao层基类,Dao层类继承此类,就可以使用Mybatis Plus的BaseMapper提供的标准的增删改查方法了,**注意自定义方法selectByPage,在映射文件中需要实现,用于动态SQL查询**

```
口复制代码
                                                                 Java
1
2
    public interface ICrudDao<T extends BaseEntity> extends BaseMapper<T> {
3
4
        /**
5
         * 一般要是用动态sql语句查询
         * @param entity
7
         * @return
        public List<T> selectByPage(T entity);
9
10
    }
11
```

3.1.3 service基类

Service层基类,由接口ICrudService和实现类CrudServiceImpl组成,类图如图1-9所示。

图1-9 Service基类层类图

ICrudService接口源码如下。

```
口复制代码
                                                                 Java
    public interface ICrudService<T extends BaseEntity> extends IService<T> {
 2
 3
        /**
4
         * 分页查询方法
5
         * @param entity
         * @param pageNum
6
 7
         * @param pageSize
         * @return
8
9
         */
        PageInfo<T> listPage(T entity, int pageNum, int pageSize);
10
11
12
        /**
13
         * 查询所有方法
        * @param entity
14
15
         * @return
16
         */
        List<T> list(T entity);
17
18
19
   }
```

CrudServiceImpl实现类源码如下。

```
Java D复制代码
    public class CrudServiceImpl<T extends BaseEntity> extends
    ServiceImpl<ICrudDao<T>, T> implements ICrudService<T> {
2
3
        @Override
4
        public PageInfo<T> listPage(T entity, int pageNum, int pageSize) {
5
            return PageHelper.startPage(pageNum, pageSize).doSelectPageInfo(() ->
    {
                baseMapper.selectByPage(entity);
6
7
            });
8
        }
9
        @Override
10
11
        public List<T> list(T entity) {
12
            return getBaseMapper().selectList(Wrappers.emptyWrapper());
13
        }
14
   }
15
```

3.1.4 controler基类

控制层基类类图,如图1-10所示

图1-10 控制层基类类图

BaseController源码如下。

```
Java 口复制代码
   public abstract class BaseController<S extends ICrudService<T>, T extends
    BaseEntity> {
 2
 3
        @Autowired
4
        protected S service;
 5
 6
        protected Logger log = LoggerFactory.getLogger(this.getClass());
7
8
        /**
9
        * 加载
10
11
        * @param id
12
        * @return
        * @throws Exception
13
14
15
        @ApiOperation(value="加载", notes="根据ID加载")
        @GetMapping("/edit/{id}")
16
        public T edit(@PathVariable Long id) throws Exception {
17
18
            T entity = service.getById(id);
19
            afterEdit(entity);
20
            return entity;
21
       }
22
23
       /**
24
        * 分页查询
25
        * @param entity
26
        * @param page
27
        * @param rows
28
        * @return
29
        */
30
        @ApiOperation(value="分页查询", notes="分页查询")
        @PostMapping("/list-page")
31
32
        public PageInfo<T> listPage(T entity,
                              @RequestParam(name = "page", defaultValue = "1",
33
    required = false) int page,
34
                              @RequestParam(name = "rows", defaultValue = "10",
    required = false) int rows) {
            PageInfo<T> result = service.listPage(entity, page, rows);
            return result:
       }
37
39
        /**
40
        * 根据实体条件查询
41
        * @return
42
        */
        @ApiOperation(value="查询", notes="根据实体条件查询")
43
44
        @RequestMapping(value = "/list", method = {RequestMethod.POST,
    RequestMethod.GET})
```

```
45
        public List<T> list(T entity) {
46
            List<T> list = service.list(entity);
47
            return list;
        }
48
49
50
        /**
51
         * 增加, 修改
52
         */
        @ApiOperation(value="保存", notes="ID存在修改, 不存在添加")
53
        @PostMapping("/save")
54
        public ResponseBean save(T entity) throws Exception {
55
56
            ResponseBean rm = new ResponseBean();
57
            try {
                beforeSave(entity); //保存前处理实体类
58
                service.saveOrUpdate(entity);
59
                rm.setModel(entity);
60
            } catch (Exception e) {
61
62
                e.printStackTrace();
                rm.setSuccess(false);
63
                rm.setMsg("保存失败");
64
            }
65
66
            return rm;
67
        }
69
        /**
70
         * 删除
71
         */
72
        @ApiOperation(value="删除", notes="根据ID删除")
73
        @GetMapping("/delete/{id}")
74
        public ResponseBean delete(@PathVariable Long id) throws Exception {
75
            ResponseBean rm = new ResponseBean();
76
            try {
77
                service.removeById(id);
78
                rm.setModel(null);
79
            } catch (Exception e) {
                e.printStackTrace();
80
81
                rm.setSuccess(false);
82
                rm.setMsg("保存失败");
83
            }
84
            return rm;
        }
87
        /**
         * 批量删除
89
         */
        @ApiOperation(value="删除", notes="批量删除")
90
91
        @RequestMapping(value = "/delete", method = {RequestMethod.POST,
    RequestMethod.GET})
        public ResponseBean delete(@RequestParam List<Long> ids) {
            ResponseBean rm = new ResponseBean();
```

```
94
             try {
                 service.removeByIds(ids);
             } catch (Exception e) {
                 e.printStackTrace();
97
                 rm.setMsg("删除失败");
                 rm.setSuccess(false);
99
100
             }
101
             return rm;
         }
102
103
104
         /**
105
         * 保存前执行
106
          * @param entity
         * @throws Exception
107
108
         public void beforeSave(T entity) throws Exception {
109
110
         }
111
112
         /**
113
        * 模板方法: 在加载后执行
114
         * @param entity
115
         */
116
         public void afterEdit(T entity) {
117
118
         }
119
120 }
```

3.2 前端复用

前端的复用思路跟后端一致,通过继承base-list,base-edit组件,把CRUD重复的业务逻辑代码 重用到base-list和base-edit组件中实现。

3.2.1 重用逻辑分析

前端用户组件功能展示效果,如图1-11所示。

图1-11 用户组件

前端字典组件功能展示效果,如图1-12所示。

图1-12 字典组件

通过分析得到如下结论

- 增删改查功能是乘客和用户都有的功能方法,因此可重用
- 加入黑名单方法是用户特有方法,乘客没有的方法,因此不可重用

实现前端组件的重用需要考虑前端组件发送请求给后端的地址,分析如下。

- 1. 用户
- 分页查询 /security/user/list-page
- 添加修改保存 /security/user/save
- 2. 乘客
- 分页查询 /admin/dict/list-page
- 添加修改保存 /admin/dict/save 访问地址的前两部分跟前端路由地址的前两部分相同,如图1–13所示。

图1-13 用户前端路由地址

同时也要让路由name跟这两个变量产生联系,有此约定,前端组件才能更好的复用

3.2.1 base-list

base-list.js组件实现,列表形态的表格数据CRUD操作,比如用户,乘客,车次等。代码如下。

```
JavaScript □复制代码
    import instance from '@/libs/api/index'
    import Qs from 'qs'
2
    import { mapMutations } from 'vuex'
4
5
    export const baseList = {
6
7
     data () {
        return {
8
9
         // 当前路由的子目录/admin/post/1 -> security
10
         namespace: '',
11
         // 当前路由的最后访问路径/admin/post/1-> post
         entityName: '',
12
13
         // 初始化信息总条数
14
         total: 0,
15
         // 每页显示多少条
16
         pageSize: 10,
17
         // 显示的数据
18
         rows: []
       }
19
20
     },
21
22
     methods: {
23
        ...mapMutations([
24
          'closeTag',
25
          'addTag'
26
       ]),
27
       // 添加
28
        add () {
29
         let r = this.$store.state.app.tagNavList.find((item) => {
            return item.name == `edit_${this.namespace}_${this.entityName}`
30
31
         })
32
         if (!r) {
33
           this.$router.push({
              name: `edit_${this.namespace}_${this.entityName}`
34
35
             // query: { id: id }
           })
37
         } else {
           this.closeTag(r)
            r.query = { id: '' }
39
40
           this.$router.push(r)
         }
41
42
        },
43
       // 删除
        remove (id, index) {
44
45
         this.$Modal.confirm({
46
           title: '确认删除',
47
            content: '确定要删除吗?',
48
            on0k: () => {
```

```
instance.get(`/${this.namespace}/${this.entityName}/delete/` +
    id).then(response => {
50
                this.$Message.info('删除成功')
51
                this query()
              }).catch(error => {
52
                console.log(error)
53
54
             })
55
            }
56
          })
57
        },
        // 批量删除
58
59
        removeBatch () {
60
          if (this.$refs.selection.getSelection().length > 0) {
            this.$Modal.confirm({
61
              title: '确认删除',
62
              content: '确定要删除吗?',
63
64
              on0k: () => {
                let params = new URLSearchParams()
65
                this.$refs.selection.getSelection().forEach((o) => {
66
                  params.append('ids', o.id)
67
                })
68
69
                instance.post(`/${this.namespace}/${this.entityName}/delete`,
    params).then(response => {
                  this.$Message.info('删除成功')
70
                  this.query()
71
72
                })
73
              }
            })
74
75
          } else {
76
            this.$Message.info('请选择删除的数据')
77
          }
78
        },
79
        // 修改
        edit (id) {
80
          let r = this.$store.state.app.tagNavList.find((item) => {
81
            return item.name == `edit ${this.namespace} ${this.entityName}`
82
83
          })
          if (!r) {
84
            this.$router.push({
              name: `edit_${this.namespace}_${this.entityName}`,
              query: { id: id }
87
            })
          } else {
89
            this.closeTag(r)
90
            r.query = { id: id }
91
92
           this.$router.push(r)
93
          }
94
        },
        // 查询
        query () {
```

```
instance.post(`/${this.namespace}/${this.entityName}/list-page`,
     Qs.stringify(this.formData)).then(response => {
             this.rows = response.data.list
99
             this.total = response.data.total
           }).catch(error => {
100
             console.log(error)
101
102
           })
103
         },
         // 分页
104
         changePage (index) {
105
           this.formData.page = index
106
107
           this query()
108
         },
         // 设置每页行数
109
         changePageSize (size) {
110
           this.formData.page = 1
111
112
           this.formData.rows = size
113
           this query()
         }
114
115
       },
       mounted () {
116
117
         let arrays = this.$route.path.split('/')
118
         this.namespace = arrays[1]
119
         this.entityName = arrays[2]
120
         this.query()
       }
121
122 }
```

注意代码中的2个关键

• namespace: 对应模块名

• entityName:对应模块中管理的实体名称

通过上面代码得出,这两个变量对用路由中的第二个和第三个子目录,用户路由为 /admin/user ,得到

- namespace=admin
- entityName=user

组件中的所有id和方法调用都与这两个变量有关,以及访问路径都跟这两个变量有关系,我们做好约定,才能进行代码复用,这里要特别注意,具体使用时直接混入即可代码,如图1-14所示。

```
base-list.js × V list.vue ×

import {baseList} from '@/libs/crud/base-list'

export default {
    mixins: [baseList],
    data () {
    return {
```

图1-14 复用前端base-list组件

3.2.2 base-edit

base-edit.js组件实现了,前端修改,添加业务代码的复用,实现思路跟base-list相似,比如用户修改,乘客修改等。代码如下。

```
JavaScript 日复制代码
    import instance from '@/libs/api/index'
 2
    import Qs from 'qs'
3
    import { mapMutations } from 'vuex'
4
 5
    export const baseEdit = {
6
      data () {
 7
        return {
          // 当前路由的子目录/admin/post/1 -> security
8
9
          namespace: '',
10
          // 当前路由的最后访问路径/admin/post/1-> post
11
          entityName: ''
12
        }
13
      },
14
      methods: {
15
        ...mapMutations([
          'closeTag'
16
17
        ]),
        /**
18
19
             * 模板方法: 提交前用来处理保存的数据
20
21
        beforeSubmit () {
          alert('b')
22
23
        },
24
25
        // 提交
26
        handleSubmit (name) {
27
          this.$refs[name].validate((valid) => {
            if (valid) {
28
              instance.post(`/${this.namespace}/${this.entityName}/save`,
29
    Qs.stringify(this.formData, { arrayFormat: 'repeat' })).then(response => {
30
                this.$Message.success(response.data.msg)
31
                this.go2list()
32
              })
            } else {
33
34
              this.$Message.error('Fail!')
            }
          })
        },
37
        // 重置
        handleReset (name) {
39
40
          this.$refs[name].resetFields()
41
        },
        // 根据ID加载数据
42
43
        get (id) {
44
          instance.get(`/${this.namespace}/${this.entityName}/edit/` +
    id).then(response => {
            this.formData = Object.assign(response.data)
45
          }).catch(error => {
46
```

```
console.log(error)
47
           })
48
49
        },
50
51
        go2list () {
           this.closeTag(this.$route)
52
53
        }
      },
54
55
56
      mounted () {
         let arrays = this.$route.name.split('_')
57
58
        this.namespace = arrays[1]
59
        this.entityName = arrays[2]
60
        let id = this.$route.query.id
61
62
         if (id) {
          this.get(id)
63
64
        } else {
           // Object.keys(this.formData).forEach(key => this.formData[key] = '')
65
        }
66
      }
67
    }
68
```

3.2.3 base-tree

树状结构数据的重用逻辑和表格数据相似,无非就是加入父节点ID(parentId)处理,比如下图部门和菜单组件的功能,如图1–15所示

图1-15 树状结构组件

base-tree-list.js实现了,前端树状结构数据列表的业务代码复用,比如部门和菜单列表操作。代码如下。

```
JavaScript 日复制代码
    import Qs from 'qs'
 2
    import Vue from 'vue'
 3
    import ZkTable from 'vue-table-with-tree-grid'
4
    import { listToTree } from '@/libs/util'
5
    import instance from '@/libs/api/index'
6
 7
8
    import {baseList} from './base-list'
9
    Vue_use(ZkTable)
10
    export const baseTreeList = {
11
12
      mixins: [baseList],
13
      // 表格各行的数据
      data () {
14
15
        return {
16
          props: {
            stripe: true, // 是否显示间隔斑马纹
17
            border: true, // 是否显示纵向边框
18
19
            showHeader: true, // 是否显示表头
            showSummary: false, // 是否显示表尾合计行
20
21
            showRowHover: true, // 鼠标悬停时, 是否高亮当前行
            showIndex: false, // 是否显示数据索引
22
            treeType: true, // 是否为树形表格
23
            isFold: true, // 树形表格中父级是否默认折叠
24
25
            expandType: false, // 是否为展开行类型表格(为 True 时, 需要添加作用域插槽,
    它可以获取到 row, rowIndex)
            selectionType: false// 是否显示间隔斑马纹
26
27
          },
28
          // 初始化信息总条数
29
          total: 0.
30
          // 每页显示多少条
31
          pageSize: 10,
32
          // 显示的数据
33
          rows: []
        }
34
      },
      methods: {
        // 杳询
37
        query () {
          instance.post(`/${this.namespace}/${this.entityName}/list`,
    Qs.stringify(this.formData)).then(response => {
40
           this.rows = listToTree(response.data)
41
          }).catch(error => {
            console.log(error)
42
43
          })
44
        },
45
        addRoot () {
          this.$router.push({
46
```

```
name: `edit_${this.namespace}_${this.entityName}`
47
48
          })
49
        },
50
        // 添加
        addChild (id) {
51
          this.$router.push({
52
53
             name: `edit_${this.namespace}_${this.entityName}`,
54
             query: {parentId: id}
          })
55
56
        }
57
      }
58
    }
```

base-tree-edit组件实现了,树状结构数据的修改组件的复用,也就是增加了parentld的处理,代码如下。

```
JavaScript 口复制代码
    import { baseEdit } from './base-edit'
1
2
3
    export const baseTreeEdit = {
4
      mixins: [baseEdit],
5
      created () {
        let arrays = this.$route.name.split('_')
6
7
        this.namespace = arrays[1]
        this.entityName = arrays[2]
8
9
        let id = this.$route.query.id
10
        this.formData.parentId = this.$route.query.parentId
11
        if (id) {
12
          this.get(id)
13
14
        }
15
      }
16
   }
```

4. 岗位管理

4.1 后端代码

4.1.1 实体类

```
Java D复制代码
    package com.lxs.legou.admin.po;
 2
 3
    import com.baomidou.mybatisplus.annotation.TableField;
4
    import com.baomidou.mybatisplus.annotation.TableName;
    import com.lxs.legou.core.po.BaseEntity;
 5
    import lombok.Data;
6
 7
8
    @Data
9
    @TableName("post_")
10
    public class Post extends BaseEntity {
11
12
      @TableField("name ")
13
      private String name;
      @TableField("title_")
14
15
      private String title;
      @TableField("desc_")
16
      private String desc;
17
18
19 }
```

4.1.2 dao

```
Java 口复制代码

package com.lxs.legou.admin.po.Post;
import com.lxs.legou.core.dao.ICrudDao;

public interface PostDao extends ICrudDao<Post> {

}
```

映射文件, 主要为了实现动态查询, 代码如下。

```
<?xml version="1.0" encoding="UTF-8" ?>
    <!DOCTYPE mapper PUBLIC "-//mybatis.org//DTD Mapper 3.0//EN"</pre>
    "http://mybatis.org/dtd/mybatis-3-mapper.dtd">
3
    <mapper namespace="com.lxs.legou.admin.dao.PostDao">
4
 5
      <select id="selectByPage" resultType="Post">
 6
        select
7
          *
8
        from
9
          post
10
        <where>
        <if test="title != null and title != ''">
11
12
          title_ like '%${title}%'
13
        </if>
        <if test="name != null and name != ''">
14
15
          and name_ like '%${name}%'
16
        </if>
17
        </where>
18
      </select>
19
20
    </mapper>
```

4.1.3 service

接口

```
Java 口复制代码
    package com.lxs.legou.admin.service;
1
2
3
    import com.lxs.legou.admin.po.Post;
4
    import com.lxs.legou.core.service.ICrudService;
5
6
    /**
7
    * @Title:
8
    * @Description:
9
10
    * @Copyright 2019 lxs - Powered By 雪松
11
    * @Author: lxs
12
    * @Date: 2019/10/9
13
    * @Version V1.0
14
15
    public interface IPostService extends ICrudService<Post> {
16
17
    }
```

```
Java D复制代码
    package com.lxs.legou.admin.service.impl;
2
3
    import com.lxs.legou.admin.po.Post;
4
    import com.lxs.legou.admin.service.IPostService;
5
    import com.lxs.legou.core.service.impl.CrudServiceImpl;
6
    import org.springframework.stereotype.Service;
7
8
    @Service
    public class PostServiceImpl extends CrudServiceImpl<Post> implements
    IPostService {
10
11
   }
```

4.1.4 Mybatis配置类

```
口复制代码
                                                                 Java
    @Configuration
2
    @MapperScan("com.**.dao")
3
    public class MybatisPlusConfig {
4
5
        /**
6
        * 分页插件
7
         */
8
        @Bean
9
        public PaginationInterceptor paginationInterceptor() {
            // 开启 count 的 join 优化,只针对 left join !!!
10
11
            return new PaginationInterceptor().setCountSqlParser(new
    JsqlParserCountOptimize(true));
12
        }
13
14
        @Bean
15
        public PageInterceptor pageInterceptor() {
16
            return new PageInterceptor();
        }
17
18
   }
```

4.2 前端组件

4.2.1 list.vue

```
JavaScript   口复制代码
    <template>
 2
        <div>
 3
            <div>
 4
                <Form ref="formData" :model="formData" :label-width="80">
 5
                    <Row style="margin-top: 10px;">
 6
                        <Col span="8">
 7
                        <FormItem label="名称" prop="name">
                             <Input v-model="formData.name" placeholder="名称">
 8
    </Input>
 9
                        </FormItem>
                        </Col>
10
                        <Col span="8">
11
12
                        <FormItem label="描述" prop="title">
13
                             <Input v-model="formData.title" placeholder="描述">
    </Input>
14
                        </FormItem>
15
                        </Col>
                        <Col span="8">
16
17
                            <Divider type="vertical" />
18
                            <Button type="primary" @click="add">添加</Button>
19
                            <Button type="primary" @click="removeBatch"</pre>
    style="margin-left: 8px">删除</Button>
20
                            <Button type="primary" @click="query" style="margin-</pre>
    left: 8px">查询</Button>
21
                        </Col>
22
                    </Row>
23
                </Form>
24
            </div>
25
26
            <div>
27
                <Table stripe ref="selection" :columns="columns" :data="rows">
    </Table>
28
            </div>
            <div class="paging">
29
30
                <Page :total="total" :page-size="pageSize" show-sizer show-</pre>
    elevator show—total
31
                      @on-change="changePage" @on-page-size-
    change="changePageSize"></Page>
            </div>
32
33
        </div>
34
   </template>
35
   <style scoped>
        .paging {
            float: right;
37
            margin-top: 10px;
39
        }
40 </style>
41
   <script>
```

```
import {baseList} from '@/libs/crud/base-list'
42
43
44
    export default {
45
      mixins: [baseList],
      data () {
46
        return {
47
48
          formData: {
            name: '',
49
            title: ''
50
51
          },
52
          columns: [
53
            {
54
              type: 'selection',
55
              width: 60,
              align: 'center'
56
57
            },
58
            {
              title: '名称',
59
              key: 'name'
60
61
            },
62
            {
63
              title: '描述',
64
              key: 'title'
65
            },
66
            {
67
              title: '操作',
68
              key: 'action',
69
              width: 150,
              align: 'center',
70
71
              render: (h, params) => {
                return h('div', [
72
73
                  h('Button', {
74
                     props: {
75
                       type: 'primary',
                       size: 'small'
76
77
                     },
78
                     style: {
                      marginRight: '5px'
79
80
                    },
81
                     on: {
                       click: () => {
82
83
                         this.edit(params.row.id)
84
                       }
                    }
                  }, '修改'),
87
